BREED MIX BY CHROMOSOME

Our advanced test identifies from where Flynn from Gaia's Den inherited every part of the chromosome pairs in his genome.

FAMILY TREE

Our algorithms predict this is the most likely family tree to explain Flynn from Gaia's Den's breed mix, but this family tree may not be the only possible one.

GERMAN SHEPHERD DOG

The German Shepherd dog is the second most popular dog breed in the United States, and the fourth most popular in the United Kingdom (where it is known as the Alsatian). This breed was standardized in Germany at the end of the 19th century from local dogs used for herding and livestock guarding. Their confidence, courageousness and keen sense of smell coupled with their notable intelligence make them highly suited to police work, military roles, and search and rescue. German Shepherds require regular physical and mental exercise and have a heavy shedding coat that comes in both short and long varieties. They were first recognized by the AKC in 1908 and later became fashionable as soldiers returning from WWI spoke highly of the German dogs and Hollywood popularized the breed with stars like Strongheart and Rin Tin Tin.

Fun Fact Despite being sometimes called the "Alsatian wolf dog", German Shepherds are not true wolf dogs—they are 100% dog. Nevertheless, German shepherds were crossed with wolves in the past to form the Czechoslovakian and Saarloos wolfdog breeds. German Shepherds, along with other breeds and sled dogs, were also used in the creation of the Chinook breed.

IRISH WOLFHOUND

Fun Fact Irish Wolfhounds are mentioned in the writings of Julius Caesar, who praised them as excellent dogs of war.

Irish Wolfhounds are best known for their extraordinary size—they seem more equine than canine. They aren't especially heavy dogs, but they are exceptionally tall. Irish Wolfhounds are an extremely ancient and well-known breed of dog from Ireland. Based on their name, people can see why Irish Wolfhounds had to be tall and imposing: Their main purpose was to hunt wolves. They have a history spanning from as early as 600 CE. Ancient wooden carvings of dogs that look very much like Irish Wolfhounds have been dated even farther back to 200 BCE. Traditionally, Irish Wolfhounds were only allowed to be owned by noblemen and royalty. In modern times, however, Irish Wolfhounds are extremely popular all around the world and are known for being loving companion dogs. Irish Wolfhounds are extremely interesting dogs. They are introverted, intelligent, and reserved. They are known for having individual personalities, thus making it hard to give an accurate description of the breed's temperament. They don't like being left alone. They become extremely attached to their families, human and otherwise, and might not do well if separated from them. If prospective owners adopt an Irish Wolfhound that isn't a puppy and has had a previous family, they'll need to do a lot of work to bond with the new dog. They tend to be standoffish with strangers; however, once they've met someone once or twice they should be friendly. Because they are so large, Irish Wolfhounds need a lot of space and aren't the best choice for apartment dwellers. If owners have the space, though, Irish Wolfhounds can thrive in any environment. They love children—especially children who are members of their family—and they do well with other dogs. Owners need to keep in mind the size of Irish Wolfhounds—they might accidentally harm or frighten a much smaller dog or child.

MATERNAL LINE

Through Flynn from Gaia's Den's mitochondrial DNA we can trace his mother's ancestry back to where dogs and people first became friends. This map helps you visualize the routes that his ancestors took to your home. Their story is described below the map.

HAPLOGROUP: A1e

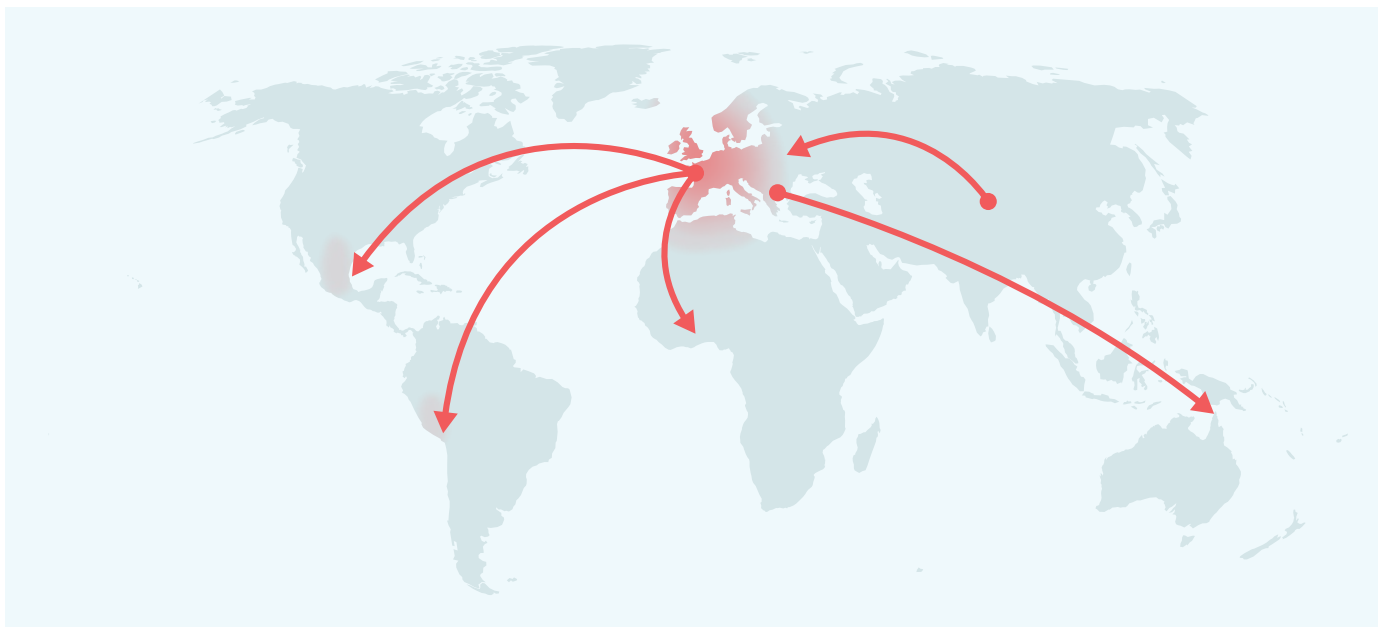

This female lineage likely stems from some of the original Central Asian wolves that were domesticated into modern dogs starting about 15,000 years ago. It seemed to be a fairly rare dog line for most of dog history until the past 300 years, when the lineage seemed to "explode" out and spread quickly. What really separates this group from the pack is its presence in Alaskan village dogs and Samoyeds. It is possible that this was an indigenous lineage brought to the Americas from Siberia when people were first starting to make that trip themselves! We see this lineage pop up in overwhelming numbers of Irish Wolfhounds, and it also occurs frequently in popular large breeds like Bernese Mountain Dogs, Saint Bernards and Great Danes. Shetland Sheepdogs are also common members of this maternal line, and we see it a lot in Boxers, too. Though it may be all mixed up with European dogs thanks to recent breeding events, its origins in the Americas makes it a very exciting lineage for sure!

HAPLOTYPE: A25

Part of the large A1e haplogroup, we have detected this haplotype in village dogs in Mexico. We also see it in Irish Wolfhounds, Great Pyrenees, Brittanys, and Labrador Retrievers.

PATERNAL LINE

Through Flynn from Gaia's Den's Y chromosome we can trace his father's ancestry back to where dogs and people first became friends. This map helps you visualize the routes that his ancestors took to your home. Their story is described below the map.

HAPLOGROUP: A1a

Some of the wolves that became the original dogs in Central Asia around 15,000 years ago came from this long and distinguished line of male dogs. After domestication, they followed their humans from Asia to Europe and then didn't stop there. They took root in Europe, eventually becoming the dogs that founded the Vizsla breed 1,000 years ago. The Vizsla is a Central European hunting dog, and all male Vizslas descend from this line. During the Age of Exploration, like their owners, these pooches went by the philosophy, "Have sail, will travel!" From the windy plains of Patagonia to the snug and homey towns of the American Midwest, the beaches of a Pacific paradise, and the broad expanse of the Australian outback, these dogs followed their masters to the outposts of empires. Whether through good fortune or superior genetics, dogs from the A1a lineage traveled the globe and took root across the world. Now you find village dogs from this line frolicking on Polynesian beaches, hanging out in villages across the Americas, and scavenging throughout Old World settlements.

HAPLOTYPE: H1a.15

Part of the large A1a haplogroup, this haplotype is found in village dogs from across the globe (outside of Asia). As for breeds, it is primarily seen in German Shepherds, Labrador Retrievers, Nova Scotia Duck Tolling Retriever. It is by far the most common haplotype in German Shepherds.

CLINICAL TRAITS

These clinical genetic traits can inform clinical decisions and diagnoses. These traits do not predict a disease state or increased risk for disease. We currently assess one clinical trait: Alanine Aminotransferase Activity.

Alanine Aminotransferase Activity result: Low Normal

Flynn from Gaia's Den has one copy of a mutation associated with reduced ALT activity as measured on veterinary blood chemistry panels. Please inform your veterinarian that Flynn from Gaia's Den has this genotype, as ALT is often used as an indicator of liver health and Flynn from Gaia's Den is likely to have a lower than average resting ALT activity. As such, an increase in Flynn from Gaia's Den's ALT activity could be evidence of liver damage, even if it is within normal limits by standard ALT reference ranges.

More information on Alanine Aminotransferase Activity:

Known to be highly expressed in liver cells, activity levels of alanine aminotransferase, or ALT, is a common value on most blood chemistry panels and is known to be a sensitive measure of liver health. Dogs with two ancestral G alleles show "normal" activity. Dogs that have one or two copies of the derived A allele may have lower resting levels of ALT activity, known as "low normal". If your dog's result is "low normal" then when a blood chemistry panel is being interpreted the values that you and your veterinarian consider "normal" may need to be adjusted. Please note that neither a "normal" nor a "low normal" result for this predicts a disease state or increased risk for liver disease. Moreover, this mutation does not associate with increased levels of ALT: If your dog has high ALT levels, please consult your veterinarian.

GENE NAME

GG

CLEAR

GT

CARRIER

TT

AT RISK

Flynn from Gaia's Den is a carrier for a mutation in the BEST1 gene. As a carrier he or she is unlikely to show signs of the disease. If you choose to breed Flynn from Gaia's Den, we highly recommend genotyping any potential mates as breeding to another carrier or an affected dog could produce affected puppies.

DESCRIPTION

This is a nonprogressive retinal disease that, in rare cases, can lead to vision loss. All known mutations lie in the BEST1 gene and are inherited in an autosomal recessive manner. We test for mutations that have been identified in Bulldog and Mastiff breeds, the Coton de Tulear, the Lapponian herder, the Finnish Lapphund, and the Swedish Lapphund. In all of these breeds, CMR is typically only identified when a vet examines the eye with an ophthalmoscope: this magnifies and illuminates the retina which, in dogs with CMR, exhibits multiple surface abnormalities that range from small, flat folds (called "retinal folds") to larger, irregularly edged raised lesions (called "geographic lesions"). Dogs with larger lesions can suffer from vision loss. CMR is fairly non-progressive; new lesions will typically stop forming by the time a dog is an adult, and some lesions will even regress with time.

OTHER CONDITIONS

Good news! Flynn from Gaia's Den tested clear for 10 genetic conditions that are common in his breed mix.

- MDR1 Drug Sensitivity (MDR1)
- Factor VIII Deficiency, Hemophilia A (F8 Exon 1, Shepherd Variant 2)
- Achromatopsia (CNGA3 Exon 7 German Shepherd Variant)
- Renal Cystadenocarcinoma and Nodular Dermatofibrosis (RCND) (FLCN Exon 7)
- Malignant Hyperthermia (RYR1)
- Factor VIII Deficiency, Hemophilia A (F8 Exon 11, Shepherd Variant 1)
- Canine Leukocyte Adhesion Deficiency Type III (LAD3) (FERMT3)
- X-linked Ectodermal Dysplasia, Anhidrotic Ectodermal Dysplasia (EDA Intron 8)
- Mucopolysaccharidosis Type VII, Sly Syndrome (GUSB Exon 3)
- Degenerative Myelopathy (SOD1A)

FULL TEST PANEL

Flynn from Gaia's Den is also clear of 156 other genetic health conditions that Embark tests for.

To help ensure healthy breeds, every test includes analysis of our full panel of over 160 genetic health conditions.

The following pages list out all the other genetic health conditions that Flynn from Gaia's Den tested clear for.

CLEAR CONDITIONS

- P2Y12 Receptor Platelet Disorder (P2RY12) (Chromosome 23)
- Factor IX Deficiency, Hemophilia B (F9 Exon 7, Terrier Variant) (Chromosome X)
- Factor IX Deficiency, Hemophilia B (F9 Exon 7, Rhodesian Ridgeback Variant) (Chromosome X)
- Factor VII Deficiency (F7 Exon 5) (Chromosome 22)
- Factor VIII Deficiency, Hemophilia A (F8 Exon 10, Boxer Variant) (Chromosome X)
- Thrombopathia (RASGRP2 Exon 5, Basset Hound Variant) (Chromosome 18)
- Thrombopathia (RASGRP2 Exon 8) (Chromosome 18)
- Thrombopathia (RASGRP2 Exon 5, American Eskimo Dog Variant) (Chromosome 18)
- Von Willebrand Disease Type II (VWF Exon 28) (Chromosome 27)
- Von Willebrand Disease Type III (VWF Exon 4) (Chromosome 27)
- Von Willebrand Disease Type I (VWF) (Chromosome 27)
- Congenital Macrothrombocytopenia (TUBB1 Exon 1, Cavalier King Charles Spaniel Variant) (Chromosome 24)
- Canine Elliptocytosis (SPTB Exon 30) (Chromosome 8)
- Cyclic Neutropenia, Gray Collie Syndrome (AP3B1 Exon 20) (Chromosome 31)
- Glanzmann's Thrombasthenia Type I (ITGA2B Exon 12) (Chromosome 9)
- May-Hegglin Anomaly (MYH9) (Chromosome 10)
- Prekallikrein Deficiency (KLKB1 Exon 8) (Chromosome 16)
- Pyruvate Kinase Deficiency (PKLR Exon 5) (Chromosome 7)
- Pyruvate Kinase Deficiency (PKLR Exon 7 Labrador Variant) (Chromosome 7)
- Pyruvate Kinase Deficiency (PKLR Exon 7 Pug Variant) (Chromosome 7)
